Introduction

- The analysis of news media content is crucial for social science research where sequence of socio-historical events are studied significantly.
- “An event according to social scientists is an action performed by human beings that can be summed up by a verb or a name of action” (Roberto Franzosi, 2010).
- An event in Crime news could be,
  Police (Actor) arrested (Action) a thief (Actor)
- How could this be represented in computational linguistics?
Introduction

• In linguistics an event can be expressed in the form of a semantic triplet

  Subject (S) → Verb (V) → Object (O)

• Computer assisted Story grammars have been used to analyse narrative text (Quantitative Narrative Analysis)

• The disadvantage is that it is labour intensive
Goals

- We present a working system for large scale quantitative narrative analysis of news corpora experimenting with 100,000 articles about crime from the New York Times corpus.
- It automatically extracts SVO triplets out of data:
  - By weighting actors we identify the key players in a given domain.
  - By analysing the centrality of actors we identify the most influential characters in news narrative.
  - By classifying types of actions we further analyse the roles different actors play.
  - We detect changes of role in time by analysing the time series of actors.
  - We identify the subject/object bias of actors in news.
Related Work

- Our approach builds on an idea presented in (Rusu et al, 2007), for purposes of text summarisation and related tasks, and later developed also for the generation of event templates (Trampus, Mladenic, 2011) in information extraction.
- We developed that idea in various ways, in order to address the specific needs of researchers in QNA.
- Our goal is to create a working system that performs key tasks needed in that application area, and that can scale to very large corpora.

News Article:
Perry criticizes Obama for "dangerous" Mideast policy

Rick Perry accused President Barack Obama on Tuesday of not standing behind Israel as the Texas governor sought to draw Jewish voter support in his bid to win the 2012 Republican presidential nomination. Perry, an evangelical Christian who leads the opinion polls among Republican presidential hopefuls, told several dozen New York Jewish leaders that Obama's Middle East policy was "naive, arrogant, misguided and dangerous." As a Christian, I have a clear directive to support Israel. Both as an American and as a Christian, I am going to stand with Israel," Perry said.

Perry made his foray into Middle East politics as the Palestinians prepared a unilateral bid for statehood, which they are expected to present as early as Friday to the U.N. Security Council. Perry condemned those Palestinian efforts and called Obama's Middle East policy "appeasement" for contending that the Israelis and Palestinians should use the 1967 borders as the starting point for negotiations.

Performing Anaphora Resolution

Perry accused President Obama on Tuesday of not standing behind Israel as the Texas governor sought to draw Jewish voter support in governor’s bid to win the 2012 Republican presidential nomination. Perry, an evangelical Christian who leads the opinion polls among Republican presidential hopefuls, told several dozen New York Jewish leaders that Obama’s Middle East policy was "naive, arrogant, misguided and dangerous." As a Christian, Perry have a clear directive to support Israel. Both as an American and as a Christian, I’m going to stand with Israel," Perry said.

Perry made Perry’s foray into Middle East politics as the Palestinians prepared a unilateral bid for statehood, which Palestinians are expected to present as early as Friday to the U.N. Security Council. Perry condemned those Palestinian efforts and called Obama's Middle East policy "appeasement" for contending that the Israelis and Palestinians should use the 1967 borders as the starting point for negotiations.
An evaluation with the SUSANNE corpus shows that MINIPAR achieves about 88% precision and 80% recall with respect to dependency relationships.

Tags each word of the sentences with a grammatical relation:

- **i**: the relationship between a C clause and its I clause
- **mod**: the relationship between a word and its adjunct modifier
- **pnmod**: post nominal modifier
- **pcomp-c**: clausal complement of prepositions
- **pcomp-n**: nominal complement of prepositions
- **post**: post determiner
- **pre**: pre determiner
- **pred**: predicate of a clause
- **rel**: relative clause
- **vrel**: passive verb modifier of nouns
- **wha, whn**: wh-elements at C-spec positions
- **obj**: object of verbs
- **s**: surface subject

Identify Key Actors and Actions

- 100,000 articles in Crime and over 180,000 articles in Top News World
- Weighted Actors and Actions

\[
\text{Weight } w_{(\text{Actor/Action})} = \frac{f_{(\text{Actor/Action})} \text{ in Crime}}{f_{(\text{Actor/Action})} \text{ in Top News World}}
\]
**Triplet Networks**

- Network Analysis and its directed graphs provide an ideal tool to map a network of social actors involved in an event.
- To identify the most interesting triplets,
  - Filtered the triplets that contained the Top 300 Key actors and actions each year.
    - Case 1: Key Subject ➔ Key Action ➔ Object
    - Case 2: Subject ➔ Key Action ➔ Key Object
- The most frequent triplets did not reveal interesting relations.
- We generated directed networks using Cytoscape.
- The networks had subjects and objects as nodes and the verbs linking them as edges.

Spheres of Interaction

• In QNA it is also common to investigate separately different “spheres of interaction” between actors (eg: communication, aggression, etc).

Time Series Analysis - Actors

- Network measures like outdegree and hub picked up the most central and interesting actors out of the data.
Time Series Analysis - Actions
Subject/Object Bias of Actors

- The Subject/Object bias of an actor reveals the role it plays in the news narrative: that is its tendency to be portrayed as an active or passive element in the story.

\[
\text{Subj/Obj Bias of Actor}(K) = \frac{\int \text{Crime}_{\text{Subj/Obj}}(K)}{\int \text{TopNews}_{\text{Subj}}(K) + \int \text{TopNews}_{\text{Obj}}(K)}
\]
Conclusion & Future Work

• We demonstrated a system for automating narrative analysis of news corpora, a task traditionally labour intensive.
• This builds on various recent contributions from the field of Pattern analysis.
• Possible sources of error could be co-reference resolution/pronoun resolution/other steps related to parsing.
• Minipar can only parse sentences within a limit of 1024 characters.
• Future work will involve both a validation of the performance and a deployment of the system to even larger analysis tasks.
• The system can directly feed into existing tools such as PC-ACE (Program for Computer-Assisted Coding of Events, Franzosi, 2010).
• We look forward to integrate this with the larger NOAM infrastructure: News Outlets Analysis and Monitoring System.
More to come..

- Analysis of U.S Election news
- Use triplets to infer the existence of certain relations between actors
- Introducing Positive and negative weights to actions in the network
- Automatically identify allegiance of actors to a party and their role in political discourse
Thank You
