A Magna Carta for the WWW?

"Are we going to continue on the road and just allow the governments to do more and more and more control — more and more surveillance?"

Or are we going to set up a bunch of values?"

Are we going to set up something like a Magna Carta for the World Wide Web and say, actually, now it's so important, so much part of our lives, that it becomes on a level with human rights?"

Balancing privacy and security at the same is a challenge in a world without the WWW

In a world with WWW even more complicated

What are the most important issues?

What is or can be the role of Semantic Web?
