## Theorem 9. Dubreil 1939

Two equivalences  $R_a$  and  $R_b$  permute if, and only if, for each block  $C$  of the partition  $a \vee b$ , the partitions  $a|_C$  and  $b|_C$  are independent.

The condition of independence between the partitions restrained to each block of  $R \vee T$  of this theorem finds here a new interpretation: the classes of  $R \vee T$  are rectangular and mutually row and column disjoint.

This is equivalent to the statement that  $R \vee T$  is  $R$ - $T$  compatible. In general, we may restate the fundamental theorem as follows:

**Theorem 10.** *The equivalences  $R$  and  $T$  permute if, and only if,  $R \vee T = R * T$*

**End of Presentation**
